**Defi is inefficient.**

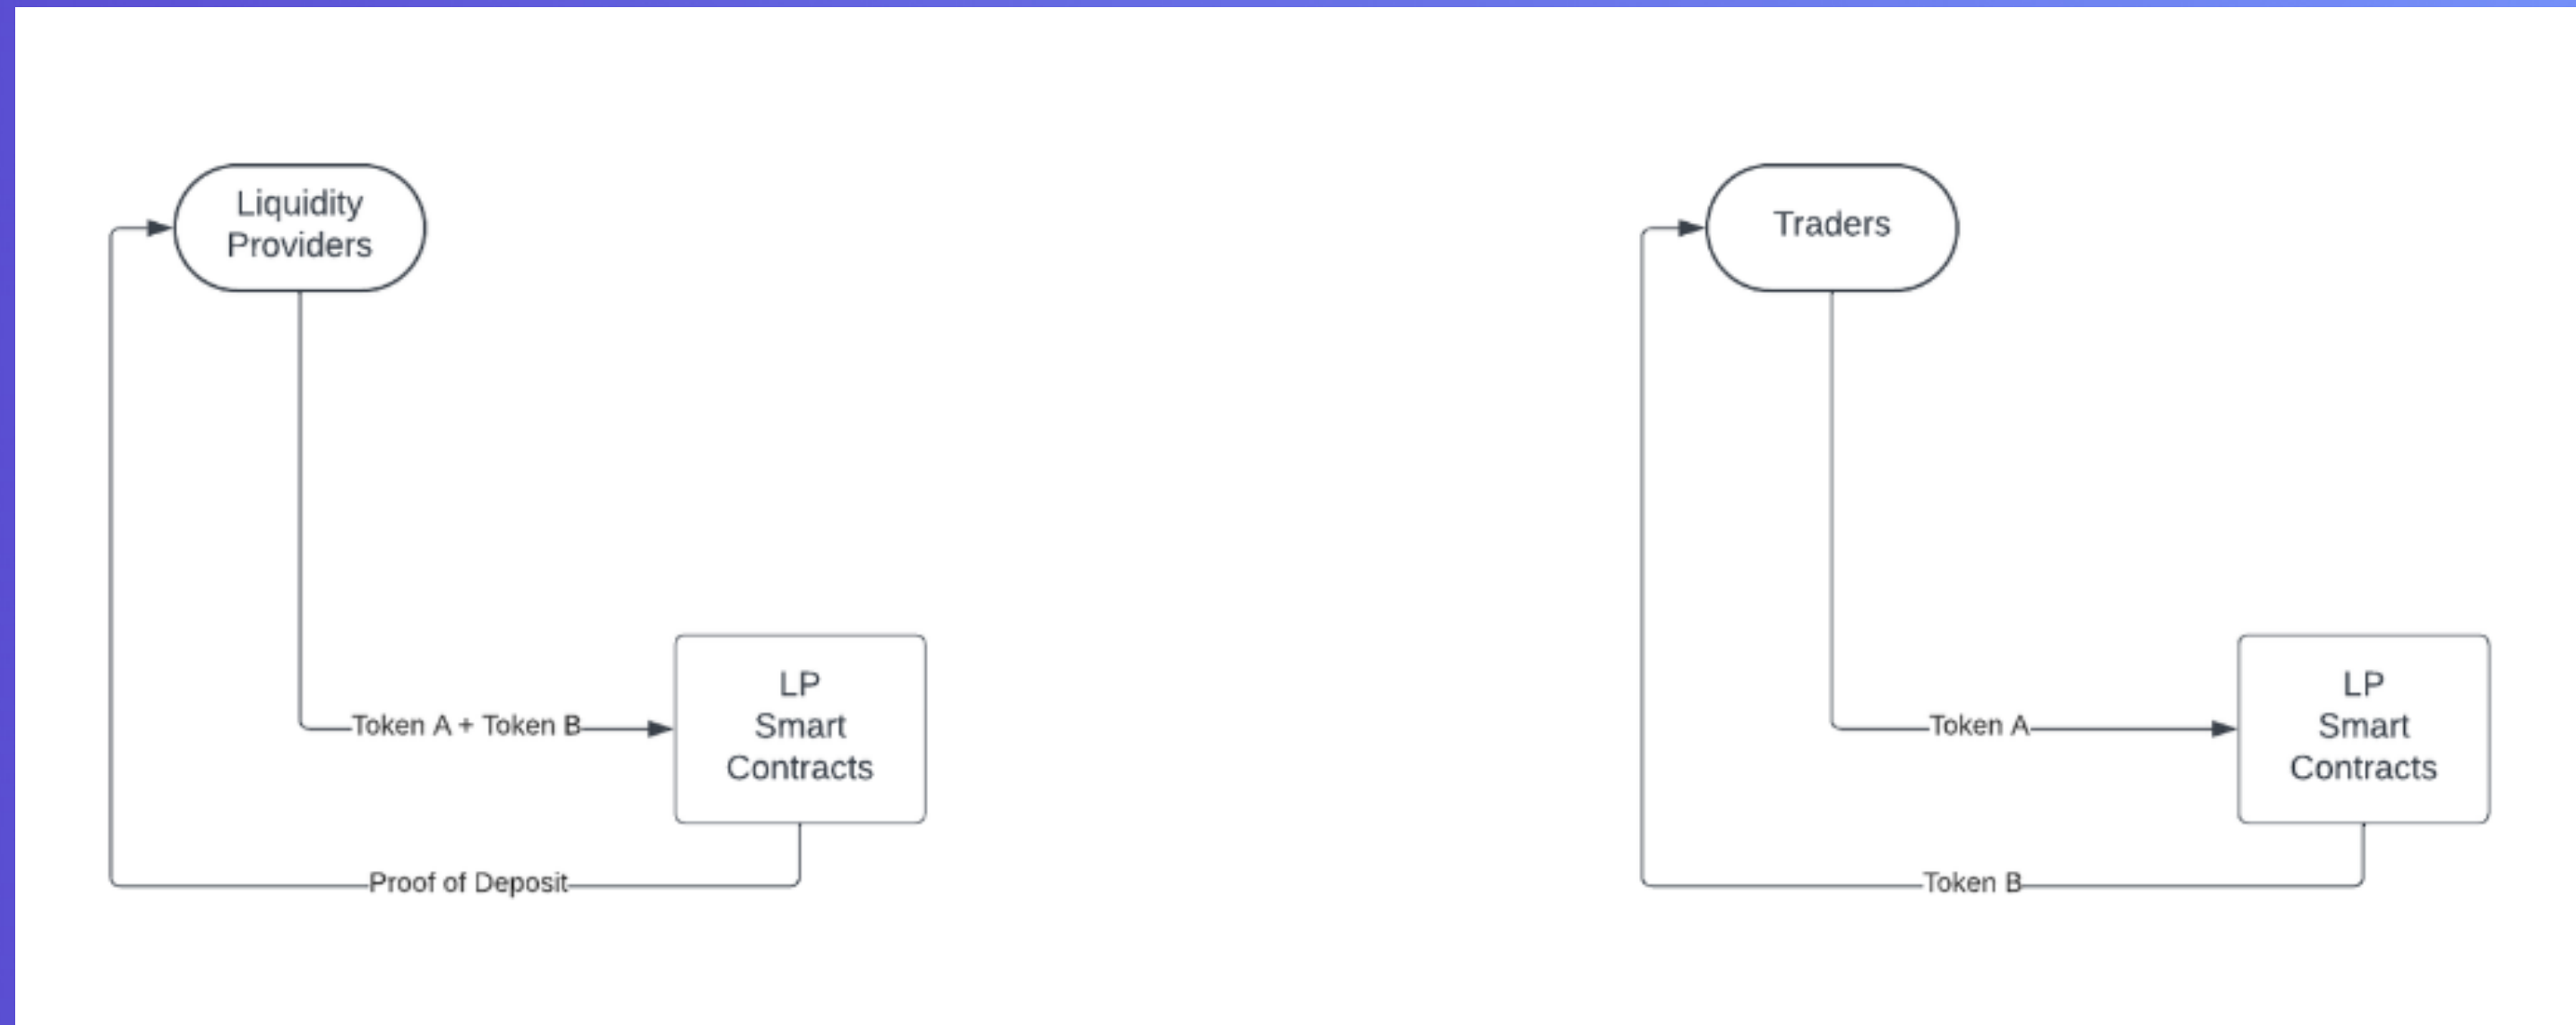

# How Existing Defi works? **Liquidity Pools**

 **Liquidity pools are bad.**

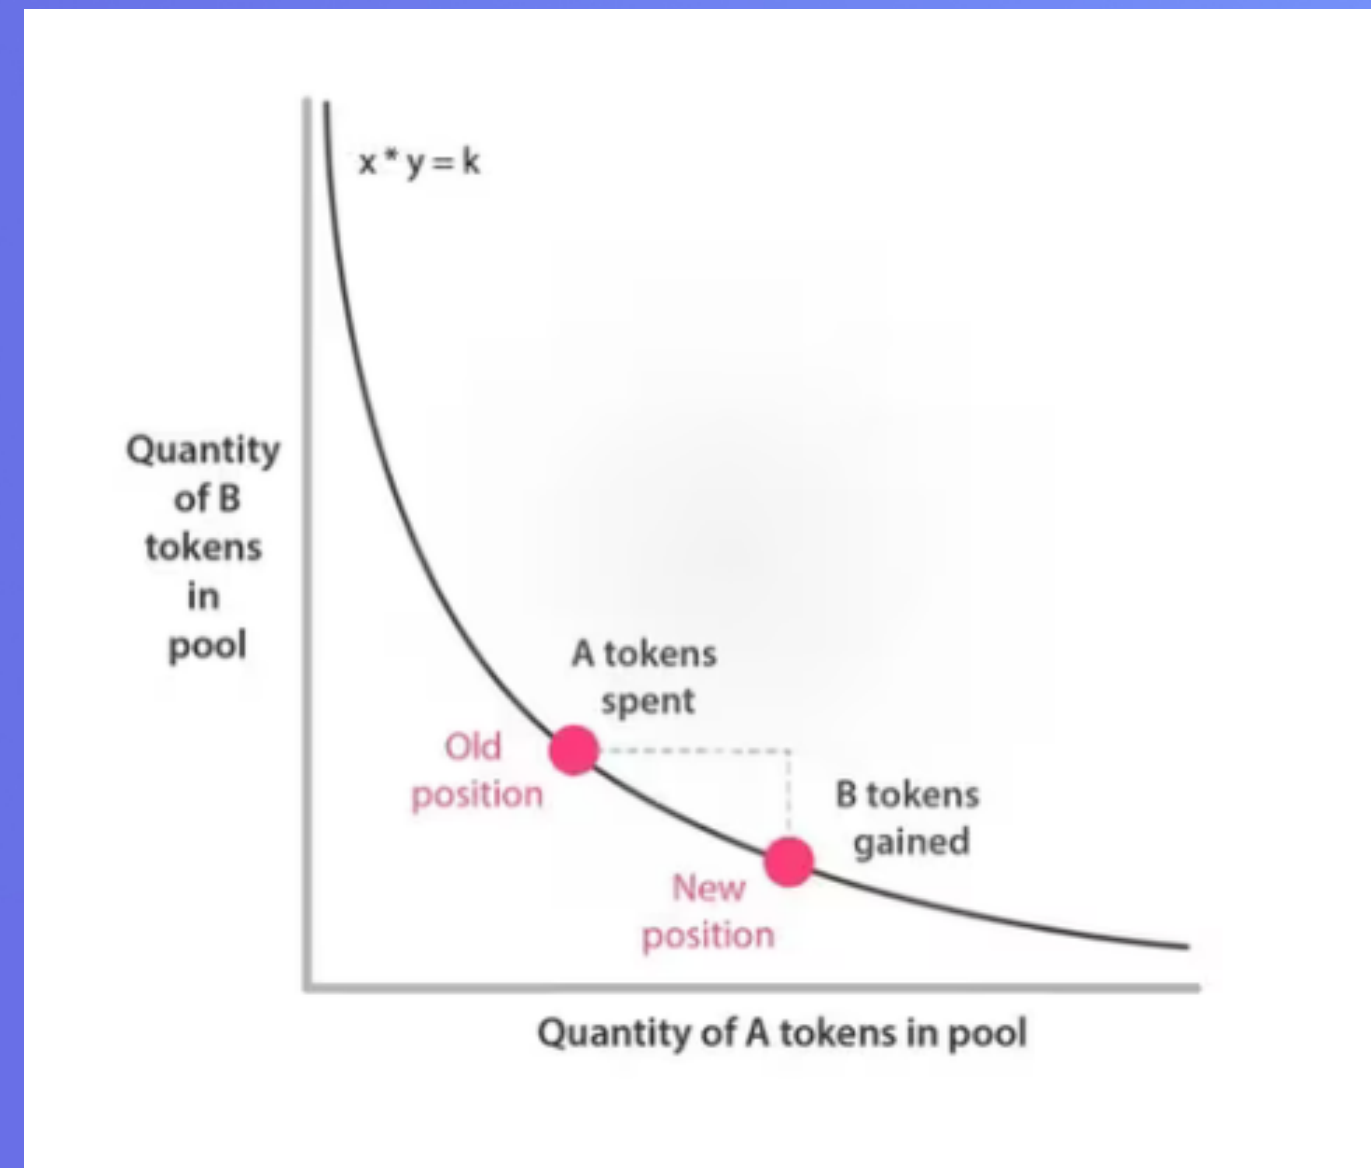

# Liquidity pools - Creation and usage

# liquidity pools - determination of prices

Automatic Market Makers

$$x * y = k$$

# Liquidity pools - They really seem bad.

- Requirement of Liquidity providers
- Slippage esp. at low liquidity
- Trades available only at market price
- Single chain ecosystem at a time
- Pool needs to be present to trade

# web3 is not only about blockchain.

## Autonomous Agents

# Autonomous Agents?

- User's representation in the digital world
- Autonomously interact with each other or external environment and take decisions
- Goal oriented
- Adaptive and improve over time
- Interoperable and integrable

# Agent Based DEX

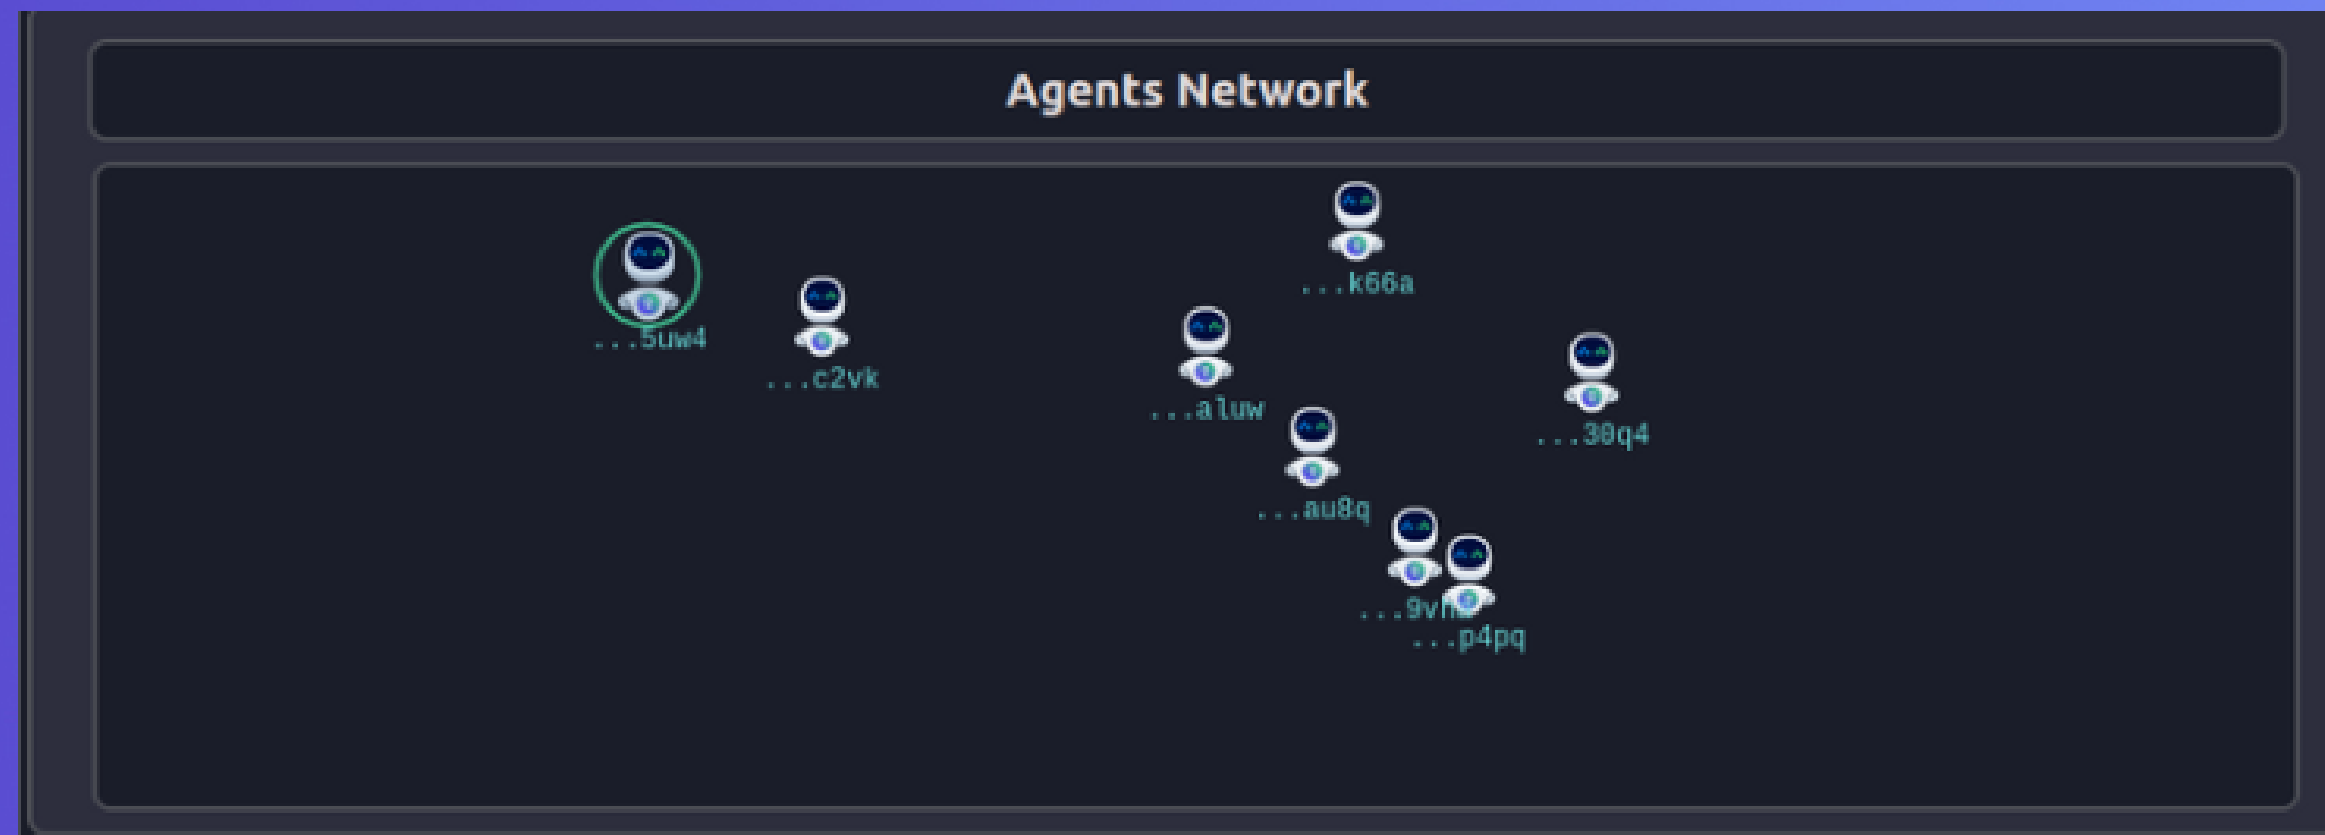

**Mettalex**  
POWERED BY FETCH.AI

**Mettalex**  
POWERED BY FETCH.AI

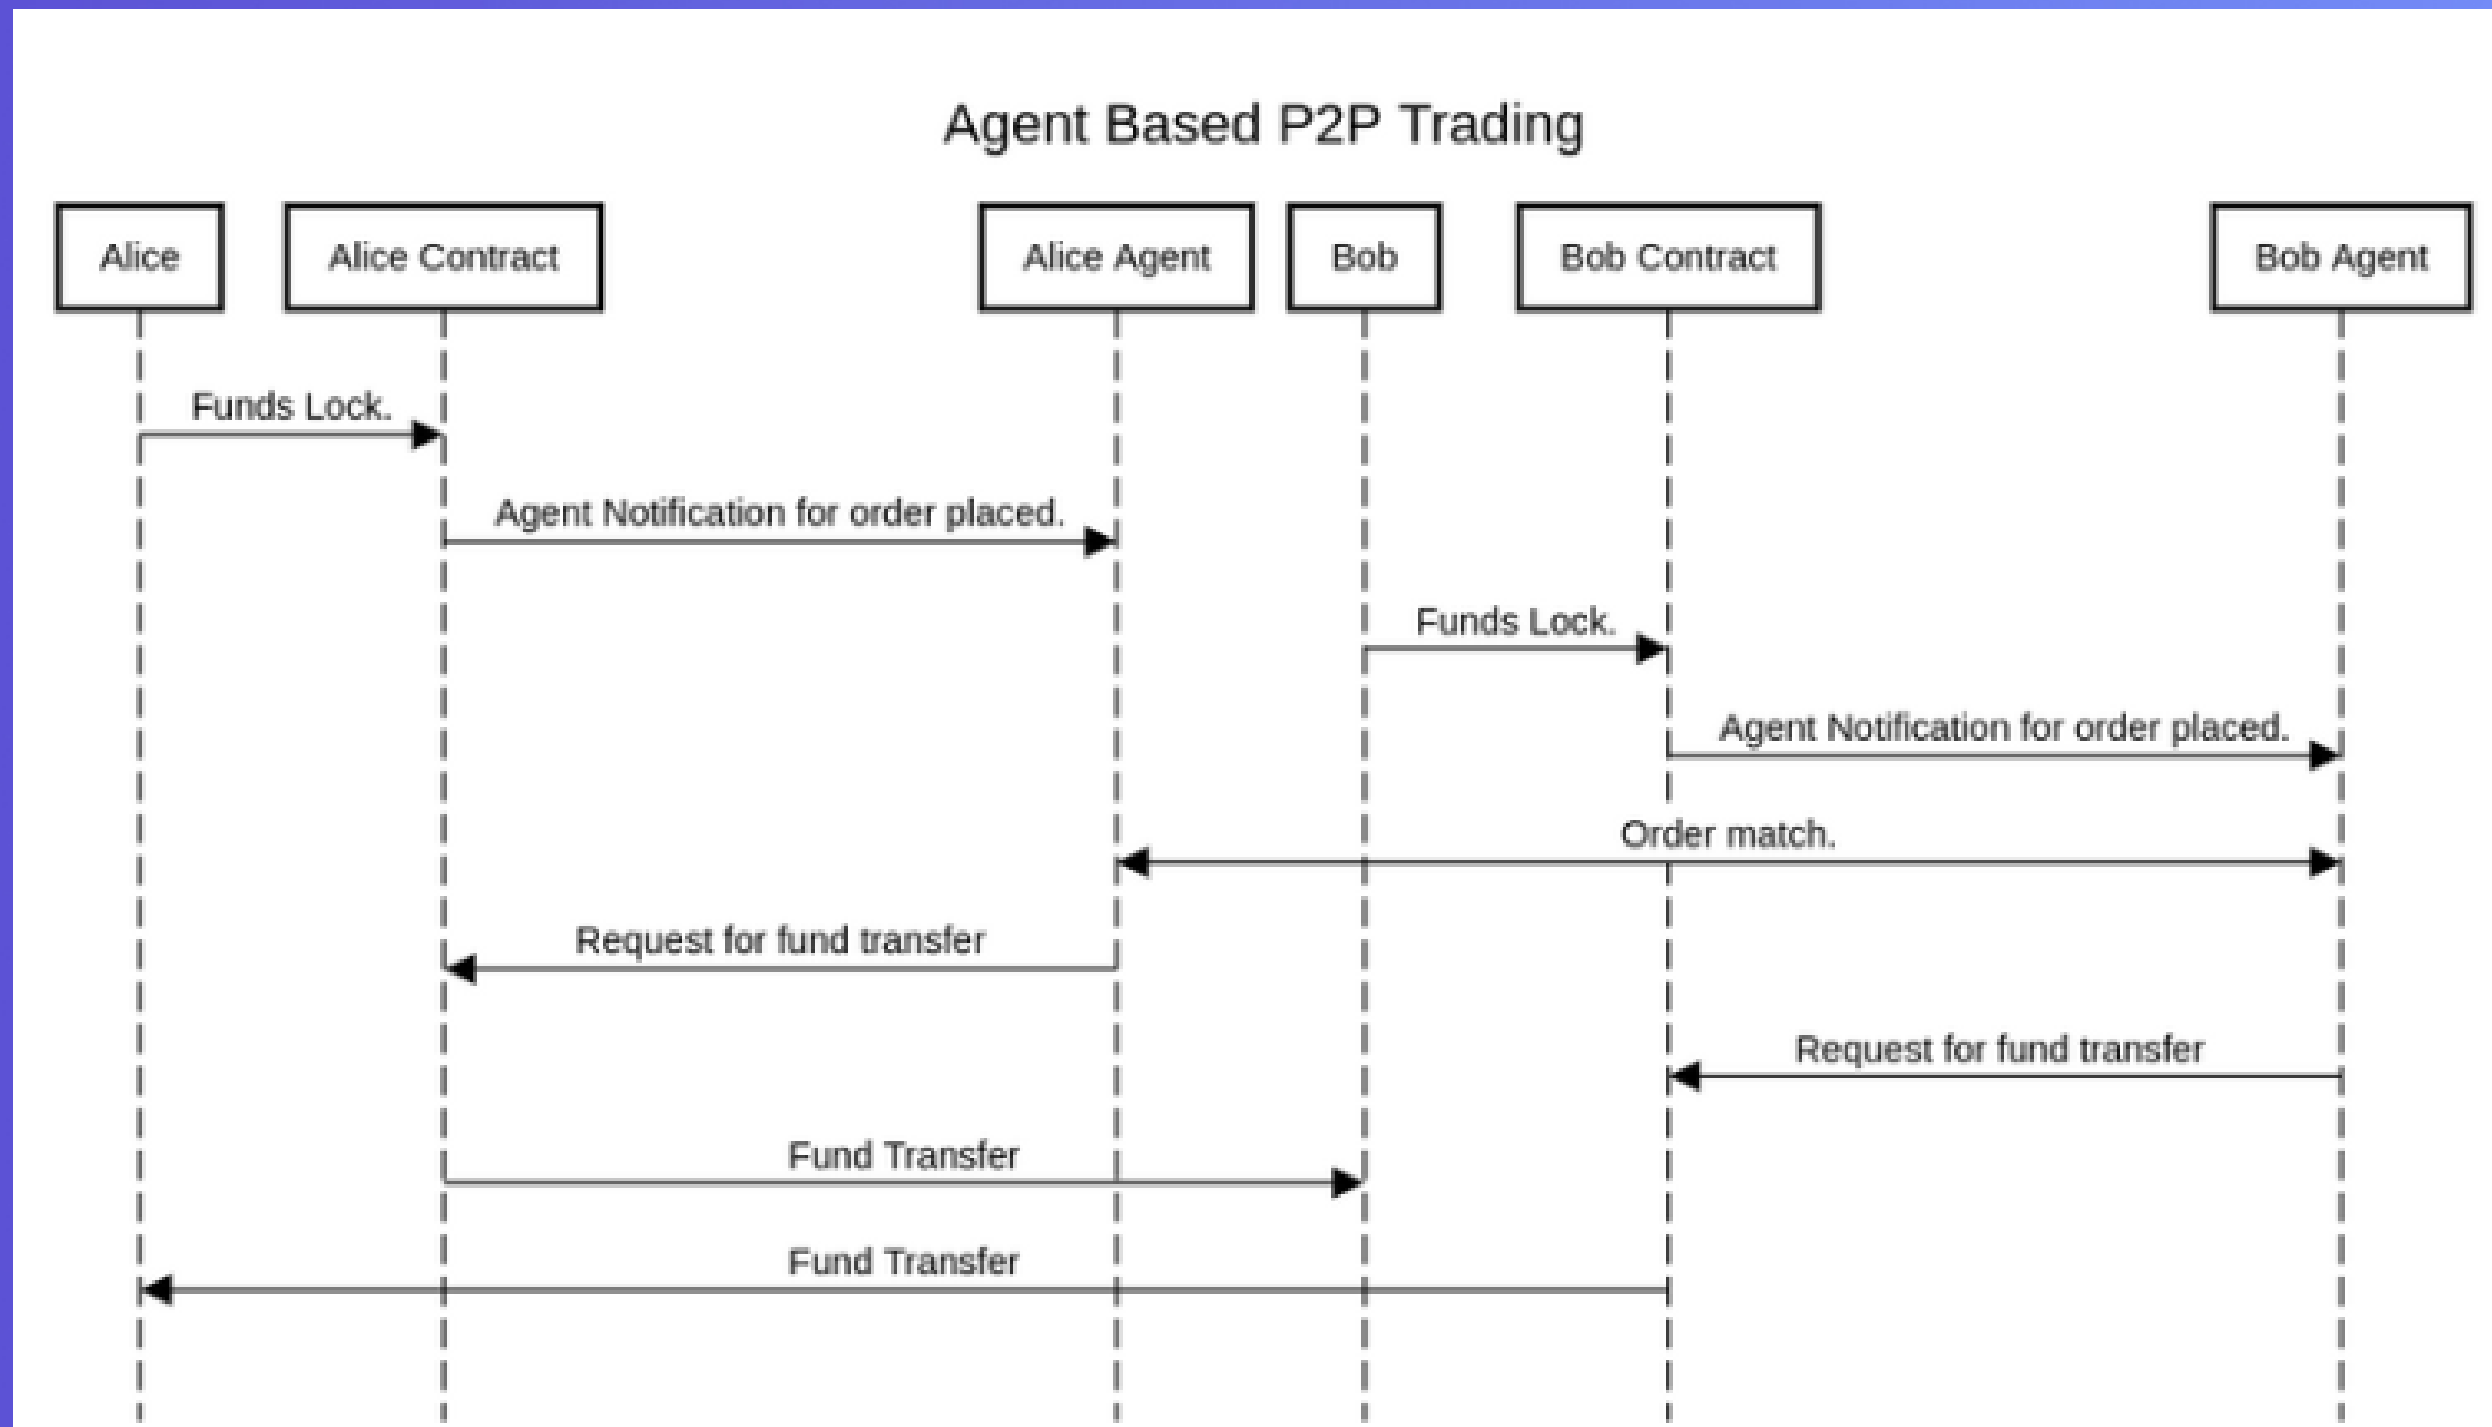

# Mettalex - agent network

- Agent network communication and execution protocol
- Interact with each other peer to peer
- Can be deployed individually anywhere

# Mettalex - agent based p2p trading

# Mettalex - this looks much better.

- No liquidity pools
- Zero slippage at any liquidity
- Chain agnostic
- Customizable
- Completely decentralized

# Open for Questions!

**Thank You.**
